Register Errand: Cancellations

A quick walkthrough for support agents

This tool guides you through registering a cancellation errand for a customer's order. You choose which bookings the request applies to and the action you took for each one — the tool then takes care of the rest: creating the tickets, writing the internal note, and logging the errand. It only takes a minute, and you can't break anything by clicking through it.

Follow these steps

1

Choose the booking(s)

The first screen shows the bookings (PNRs) on the order. Tick the one or ones this request is about, then click **Continue**.

2

Choose the passenger(s)

Pick the passengers the request covers, then continue. If it applies to everyone, select them all.

3

Choose the type

Select the type that best matches the request (for example, *Void* or *24 hour rule*). The channel — phone, chat, or email — is filled in for you automatically.

4

Choose the action for each booking

You'll see a card for each booking with its details. For every card, pick the **action you took** from the dropdown. Work through them until each booking has an action selected.

5

Submit — and you're done

Once every booking has an action, submit. Everything after this is automatic. If the customer has another request, you'll be offered the option to start again on the same ticket.

IMPORTANT · During testing only: “Contact reason”
While we're testing, the first screen also shows a **Contact reason** dropdown (Rebooking, Cancellation, Refund, and so on). Please pick the reason that matches the case. **When this goes live in Zendesk, that dropdown disappears** — the contact reason comes across from the ticket automatically, so you won't need to choose it.

What the tool does for you after you submit

You don't need to create tickets or write up the case by hand. As soon as you submit, the tool:

Creates the Zendesk tickets	Writes the internal note	Logs the errand in Edvin	Tags the ticket as completed

If the customer has more than one request

After the first errand is registered, you'll reach a closing screen. If there's another request, choose to start again — the tool resets and brings you back to the order so you can register the next one on the same ticket. No need to close or reopen anything.

Good to know

- Give **every** booking an action before you submit. A booking left blank is logged as “no action” — it isn't skipped.
- If a booking shows no actions to choose from, go back and check the **type** you selected on the earlier screen.
- You can handle several requests on one ticket using the “another request” option — you don't need to relaunch the tool.
